#### SECTION 1

#### INTRODUCTION

On September 22, 1992, the Illinois Environmental Protection Agency's (IEPA) Site Assessment Unit was tasked by Region V of the United States Environmental Protection Agency (U.S. EPA) to conduct a CERCLA Screening Site Inspection (SSI) of Standard Scrap Metal located on the south side of Chicago, Illinois.

Standard Scrap was initially placed on the Comprehensive Environmental Response, Compensation, and Liability Act Information System (CERCLIS) on August 27, 1990. This action was the result of the IEPA's concern of potential exposure of hazardous wastes to the population and environment.

Standard Scrap Metal received its initial CERCLA evaluation in the form of a Preliminary Assessment (PA) completed by a representative of the IEPA in September of 1991. In October of 1992, the IEPA's Site Assessment Unit prepared and submitted a Screening Site Inspection work plan for Standard Scrap Metal to the Region V office of the U.S. EPA. The Screening Site Inspection sampling was conducted by the IEPA on November 4 and 5, 1992 which consisted of the collection of a total of 12 soil samples.

The purposes of a Screening Site Inspection have been stated by the U.S. EPA in a directive outlining Site Assessment

Program strategies. The directive states:

## All sites will receive a screening SI to:

- Collect additional data beyond the PA to enable a more refined preliminary HRS [Hazard Ranking System] score.
- 2) Establish priorities among sites most likely to qualify for the NPL [National Priorities List].
- Identify the most critical data requirements for the Listing SI step. A screening SI will not have rigorous data quality objectives (DQOs). Based on the refined preliminary HRS score and other technical judgement factors, the site will then either be designated as NFRAP [no further remedial action planned], or carried forward as an NPL listing candidate. A Listing SI will not automatically be done on these sites, however. First, they will go through a management evaluation to determine whether they can be addressed by another authority such as RCRA [Resource Conservation and Recovery Act]. Sites that are designated NFRAP or deferred to other statutes are not candidates for a Listing SI.

The Listing SI will address all the data requirements of the revised HRS using field screening and NPL level DQOs. It may also provide needed data in a format to support remedial investigation work plan development. Only sites that appear to score high enough for listing and that have not been deferred by another authority will receive a Listing SI (U.S. EPA 1988).

Region V of the U.S. EPA has also requested that the IEPA identify sites during the Screening Site Inspection that may require removal action to remediate an immediate human health or environmental threat.

#### SECTION 2

### SITE BACKGROUND

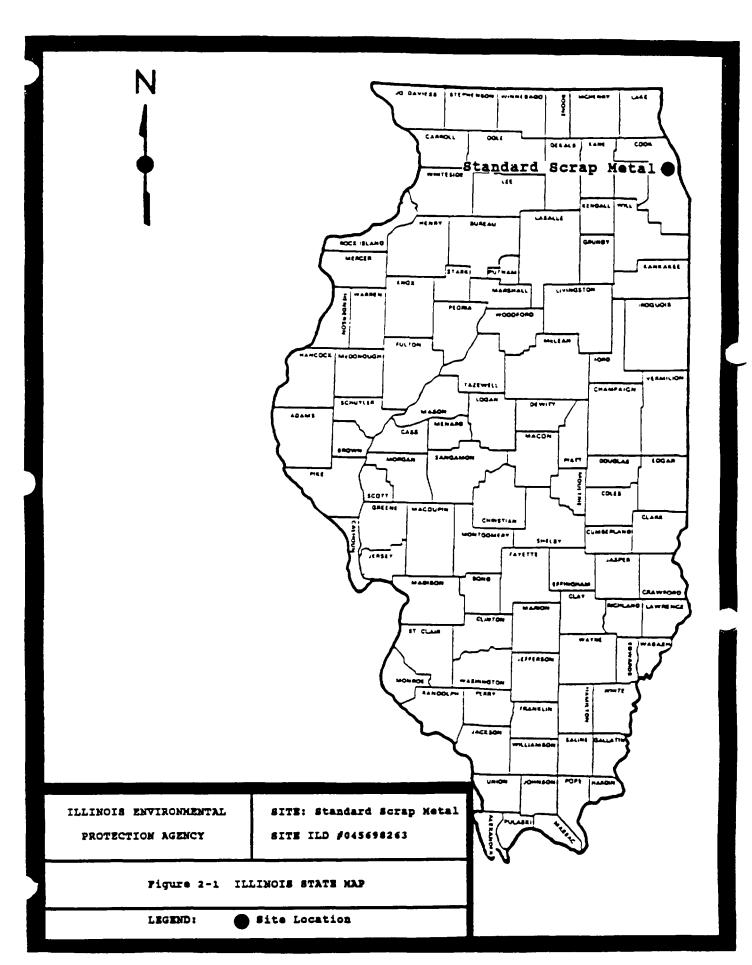

### 2.1 INTRODUCTION

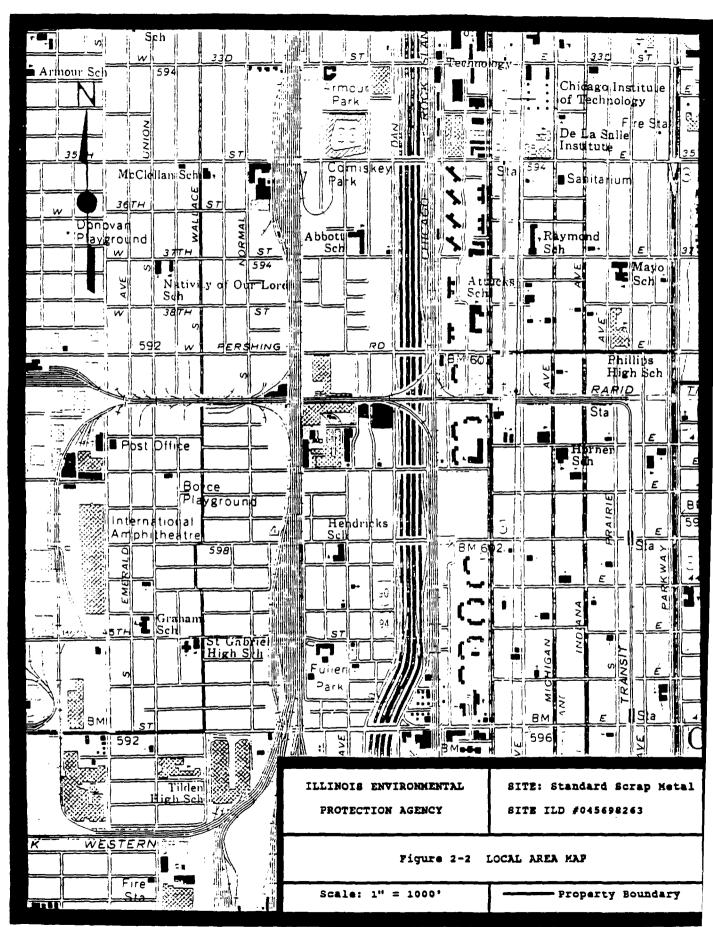

This section includes information obtained over the course of the formal CERCLA Screening Site Inspection investigation and previous U.S. EPA and IEPA activities involving Standard Scrap Metal.

## 2.2 SITE DESCRIPTION

Standard Scrap Metal is a three acre scrap yard involved in the reclamation of metals. Past and present operations have taken place on two distinct parcels of property separated by Wells Avenue. The west lot is approximately .5 acres in size and the east lot is approximately 2.5 acres. The site is located in the northeast quarter of Section 4, Township 38 North, Range 14 East of the Third Principal Meridian, Cook County. A 4-mile radius map of the area surrounding Standard Scrap can be found in Appendix A of this report.

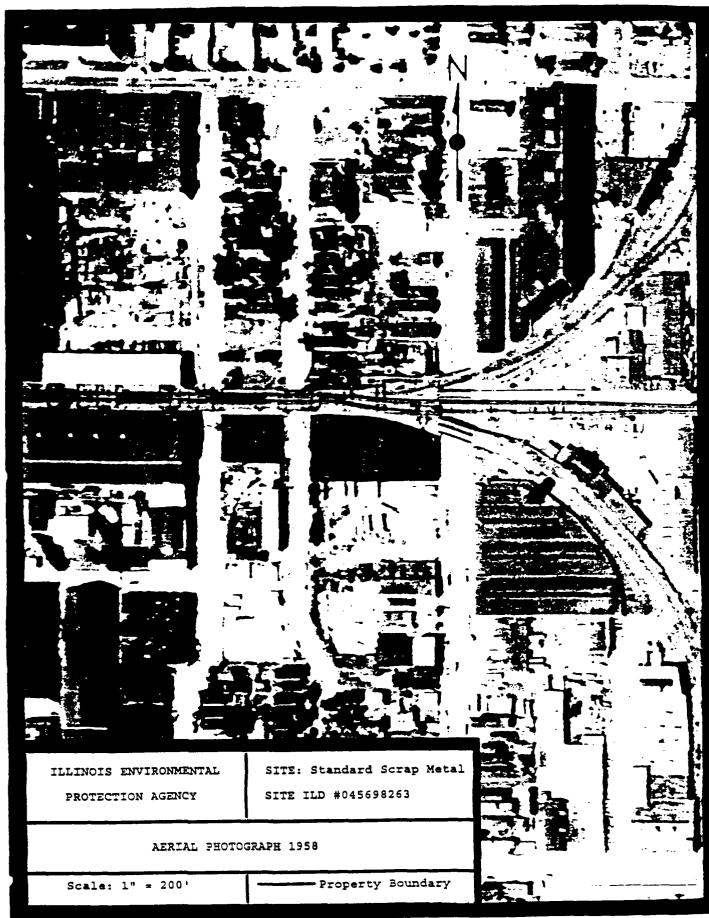

The mailing address given for Standard Scrap Metal is 4004
South Wentworth Avenue. It is located west of Interstate 9094 (Dan Ryan Expressway), one block south of Pershing Road,
east of Princeton Road, and one block north of Root Street.
The site is located in a densely populated urbanized section
on the south side of Chicago, Illinois. The surrounding area
is primarily residential with housing projects and other

industry interspersed throughout the area.

Currently, the east lot has an office building located on the west side with large piles of scrap metal located at various points throughout the property. According to aerial photographs previous to 1989, another building was located in the northeast corner of the east lot with a wire burning incinerator located immediately west of the building. The west lot is bare except for a small scale house used to weigh incoming trucks bringing scrap metal to the facility for recycling.

## DE 12 SEE SEE SEE SEE

Historic records indicate that this property has been used for industrial purposes since at least 1895. A Sanborn Fire Insurance Map from 1895 indicates a parcel of the site was used by W.B. Scace and Company as a loading area for lime and cement. The remainder of the east lot and the west lot were used by Weaver Getz and Company for unknown purposes. A Sanborn Map from 1925 shows that the Baker-Smith Coal Company operated a coal yard in the east lot.

Standard Metal Company, formed by Mr. Sam Cohen and Mr. Sam Kanter, started operations at 4004 South Wentworth Avenue in 1928. Standard Metal was involved in reclaiming aluminum and copper, the reclaimed scrap metal was then sold to steel smelters and refiners. The facility utilized one gas-fired

boiler, two aluminum sweat furnaces, and one wire burning incinerator. Operations continued until 1972 when Standard Metal Company was merged into Standard Scrap Metal Company, Incorporated in a tax free reorganization under Section 351 of the Internal Revenue Service Code. Standard Scrap Metal Company, Incorporated continued operations at the site until the company filed for bankruptcy in 1987. Phoenix Recycling started operations at the site soon after Standard Scrap filed for bankruptcy and continued operations until 1989. Phoenix Recycling was also owned by the Cohen and Kanter partnership and was involved in the reclamation of metals as well. In 1989, Chicago International Exporting began operations at the site and continues operations to this date. Chicago International Exporting is owned by Chicago International, Incorporated of which Mr. Steve Cohen, nephew of Sam Cohen, is president.

In 1973 Illinois Environmental Protection Agency (IEPA) visited Standard Scrap in order to determine the facility's compliance with Air Pollution Regulations. The inspection found that Standard Scrap Metal did not have the proper air pollution permits to operate their incinerator or sweat furnaces. A suit was filed against Sam Kanter, Sam Cohen, Benjamin Kanter doing business as Standard Metal Company for not possessing permits required by the IEPA and the City of Chicago. The complaint, filed and reinforced by the Illinois Pollution Control Board, stated that Standard Scrap could

achieve compliance by installing afterburners on the sweat furnaces. However, the afterburners were not installed and permits were not applied for until 1984. Standard Scrap Metal applied for and received a permit (83030008, 031600BRZ) on December 14, 1984 for their gas-fire boiler.

The suit brought against Standard Metal for permit violations was pursued by the Illinois Pollution Control Board on January 10, 1985. It ordered Standard Scrap Metal Company to:

- A) Cease and desist from operation of its incinerator until the necessary operating permit is obtained from the Illinois Environmental Protection Agency:
- B) Cease and desist operating either of its aluminum sweat furnaces until the necessary permits are obtained from the Illinois Environmental Protection Agency and permanently shut down the inactive aluminum sweat furnace by January 21, 1985.
- C) Install temperature gauges on each afterburner with an interlock that prevents operation unless the afterburner temperature is at least 1400 degrees Fahrenheit, and take all necessary steps to ensure adequate pre-heating of each afterburner prior to charging. These requirements are to be made conditions of the operating permits issued by the IEPA; and
- D) Within 90 days of the date of this order pay a penalty of \$30,000 for the violation of the Act and Regulations as described in this Opinion.

On February 14, 1984, another investigation was conducted at Standard Scrap Metal after a report of possible PCB contamination on site. An employee of Heatbath Corporation, the plant to the south of the west lot of Standard Scrap, observed Standard Scrap periodically dump transformer oil on the ground and igniting it. This practice was noted to have

taken place from 1977 to 1981. On one occasion the roof of the Heatbath Corporation caught fire and the Chicago Fire Department was called to extinguish the fire.

During the February 14, 1984 investigation, the IEPA collected two soil samples, one from the west lot and the other from a garage at 3949 South Wells Avenue. The sample from 3949 South Wells was the result of a complaint from the resident that oil from Standard Scrap would flow off-site into her yard. The samples from the west lot revealed 1300 parts per million (ppm) PCBs and the sample from 3949 South Wells contained 3.9 ppm PCBs. The IEPA contacted the U.S. Environmental Protection Agency after the findings and requested a PCB inspection be conducted at the site.

U.S. EPA's Toxic Substances Office conducted an inspection of Standard Scrap on March 30, 1984 to document their handling, storage, and disposal practices. U.S. EPA representatives collected six composite soil samples and one wipe sample from the west lot and a residence at 3949 South Wells. Results indicated PCB contamination in the west lot of up to 2095 ppm but no detectable contamination at the 3949 South Wells residence. These findings by the U.S. EPA resulted in a complaint filed against Standard Scrap Metal for violating regulations pertaining to disposal of PCBs. A \$25,000 civil penalty was levied against Standard Scrap Metal for improper disposal of PCBs.

On June 18, 1985; representatives of Roy F. Weston,
Incorporated under contract with the U.S. EPA collected six
samples from the west lot. The analytical results revealed
soil contamination by PCBs and dioxins. An amended complaint
was filed by the U.S. EPA against Standard Scrap with a
\$30,000 fine for violations of the Toxic Substance Control.
Act. This decision was appealed and dismissed due to lack of
evidence of violations after 1978. The dismissal was
appealed by the U.S. EPA which resulted in a reversal and the
levying of the \$30,000 fine. Standard Scrap Metal then filed
for bankruptcy and the fine was never collected.

The IEPA requested a CERCLA discovery action for Standard Scrap Metal based on telephone conversation between a former railroad employee and IEPA personnel regarding activities at the site. The rail employee indicated that during his 30 years of employment he had witnessed Standard Scrap employees cut up transformers at the facility and allow the oil to drain onto the ground on numerous occasions. The employees then ignited the oil in order to dispose of it.

#### SECTION 3

#### SCREENING SITE INSPECTION ACTIVITIES

## 3.1 INTRODUCTION

This section outlines procedures utilized and observations made during the CERCLA Screening Site Inspection conducted at Standard Scrap Metal. Specific portions of this section contain information pertaining to the reconnaissance inspection, soil sampling, decontamination procedures, and the associated analytical results. Also included in this section is information about the soil/sediment samples that were collected during the Screening Site Inspection. This is followed by a description of the analytical results and a table indicating the key samples and their contaminants.

The CERCLA Screening Site Inspection for Standard Scrap Metal was conducted in accordance with the site inspection work plan which was developed and submitted to U.S. EPA Region V prior to the initiation of field sampling activities. The "Potential Hazardous Waste Site Inspection Report" (U.S. EPA Form 2070-13) for the Standard Scrap Metal site can be found in Appendix B of this report.

## 3.2 RECONNAISSANCE INSPECTION

On October 20, 1992, Mr. Mark Weber and Mr. Pete Sorensen, of the IEPA's CERCLA Site Assessment Unit, conducted the initial Screening Site Inspection reconnaissance of Standard Scrap Metal. Access to the property to conduct the reconnaissance was denied by the attorney for Chicago International Export Company. The off-site reconnaissance included a visual inspection to determine the extent of Standard Scrap activities, the identification of possible on and off site sampling locations and requirements, and the identification of necessary health and safety requirements. During the reconnaissance inspection, it was determined that Level D personal protection equipment would be adequate during the sampling unless air monitoring equipment indicated concentrations over background.

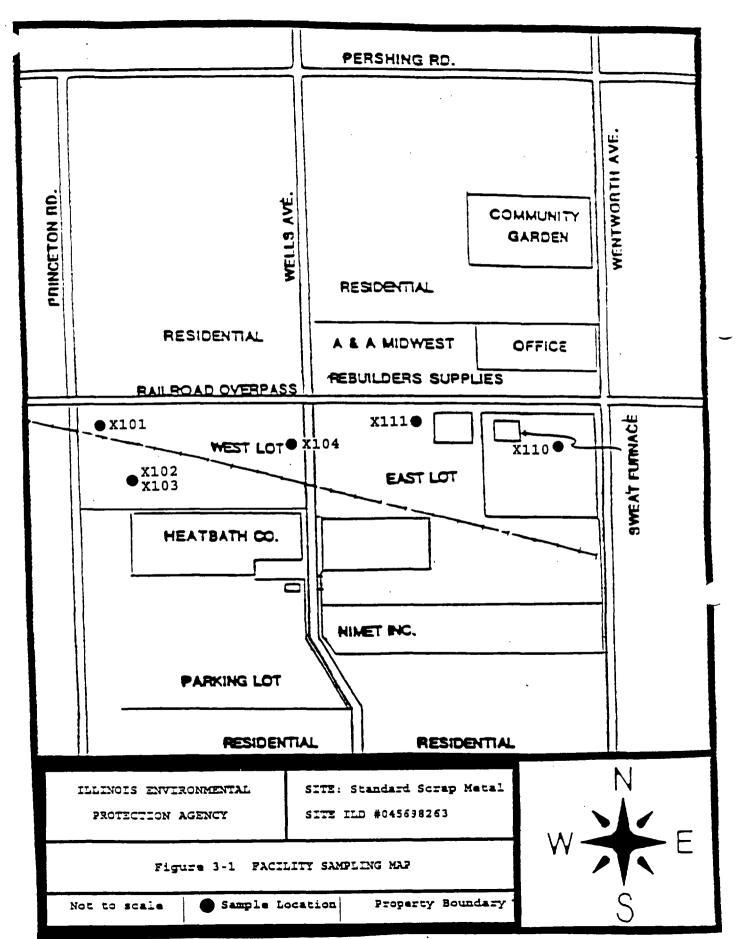

The reconnaissance confirmed that Standard Scrap Metal is located at 4004 South Wentworth Avenue in Chicago, Illinois. Current land use in close proximity of the site includes residential areas to the north and south as well as other industry located in the immediate area.

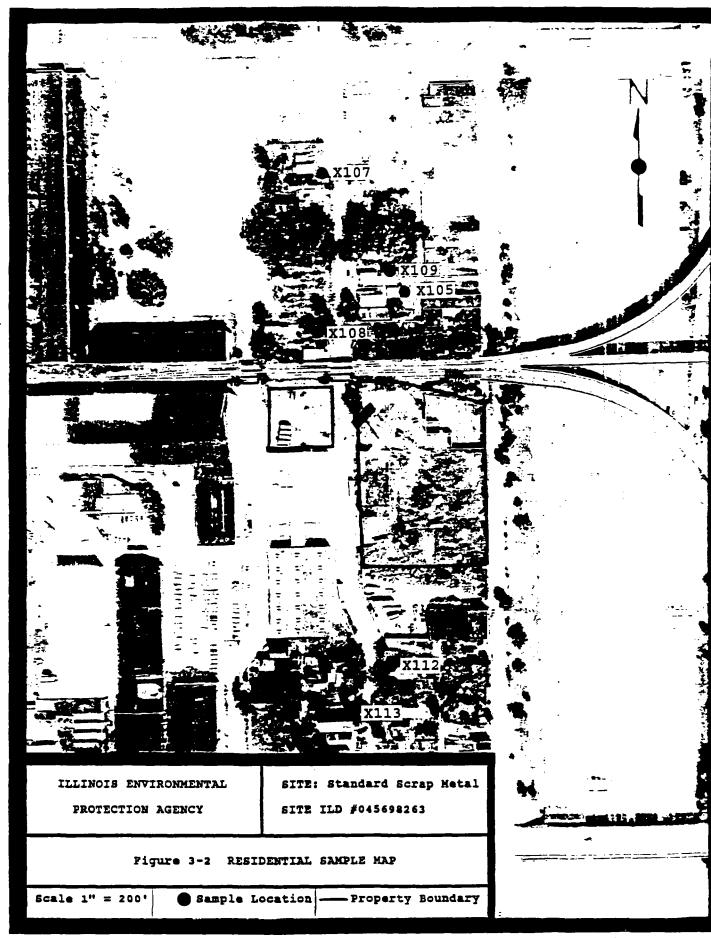

## 3.3 SITE REPRESENTATIVE INTERVIEW

The IEPA's Site Assessment Unit sent a letter to Mr. Steve
Cohen on October, 12, 1992, notifying him of the upcoming
CERCLA SSI sampling activities. Because access was denied,
IEPA representatives were unable to conduct an interview with
the current owner/operator of the site.

### 3.4 SOIL SAMPLING

IEPA personnel collected 12 soil samples on November 4 and 5,

Aerial photograph courtesy of Illinois Dept. of Transportation

1992 to determine if previously identified contaminants or other Target Compound List parameters were present at the Standard Scrap Metal facility and the surrounding community. Figures 3-1 and 3-2 are maps identifying the location of soil samples. The samples were collected with stainless steel trowels and stainless steel bucket or mud augers all of which had been decontaminated at the IEPA warehouse prior to the sampling event. The soil was transferred from the sampling device directly into IEPA sample jars supplied by the IEPA's Contract Laboratory Program.

The soil sample jars were packaged and sealed in accordance with previously documented Site Assessment Unit methods and procedures. The IEPA samples were analyzed for Target Compound List compounds (see Appendix C) by Gulf Coast Weston Laboratories in University Park, Illinois.

The dioxin analysis of the soil samples was conducted by California Analytical Laboratory in West Sacramento, California. The data was qualified by the U.S. EPA. Photographs of the CERCLA Screening Site Inspection field activities and a copy of the analytical results are provided in Appendices D and E respectively of this report.

## 3.5 DECONTAMINATION PROCEDURES

Standard IEPA decontamination procedures were followed prior to the collection of all soil samples. The procedures,

performed at the IEPA warehouse, included the steam cleaning of all equipment (spoon, trowels, bucket and mud augers, extensions and handles, etc.), then scrubbing with a liquid Alcononx solution, rinsing with hot tap water, rinsing with acetone, rinsing with hot tap water again, and final rinsing with distilled water. All equipment is air dried, then wrapped and stored in aluminum foil for transport to the field.

## 3.6 ANALYTICAL RESULTS

This section provides a summary of the analytical results of samples collected during the CERCLA Screening Site Inspection conducted at Standard Scrap Metal in Chicago, Illinois. The field activities portion of the CERCLA Screening Site Inspection include the collection of 12 soil samples by the IEPA inspection team. The 12 samples were collected to determine if any U.S. EPA Target Compound List compounds (see Appendix C) were present at the site or at potential receptors of concern. Appendix E (second volume of this report) contains the complete validated laboratory data package and a table summarizing the data. See Figures 3-1 and 3-2 for specific sampling locations.

Soil Samples: A total of 12 soil samples were taken during the Screening Site Inspection of Standard Scrap Metal. Refer to table 3-1 and 3-2 for specific analytical and sampling information regarding each soil sample.

Soil sample X101 was collected with a bucket auger near the western property line of Standard Scrap's west lot. The sampling area was bare and had little, if any, vegetative cover. This sampling location was chosen because it was in the area where transformers were broken up and their oil was allowed to flow on the ground.

Sample X102 was obtained with a bucket auger approximately 30 feet north of the northwest corner of the Heatbath building in the western lot of Standard Scrap. It was in the same general vicinity as sample X101 and was also chosen as a sampling point due to the fact that it was in the area in which the transformers were broken up as well.

Soil sample X103 was taken as a duplicate of sample X102 using the same methods. It was located approximately 30 feet north of the northwest corner of the Heatbath building in the western lot of Standard Scrap.

Soil sample X104 was collected with a bucket auger at a depth of nine to fifteen inches. It was located approximately 70 feet north of the northeast corner of the Heatbath building in the western lot of Standard Scrap. This sampling point was chosen for the same reason as the last three samples. It was located in the area in which the transformers were broken up.

Soil samples X105 - X109 were collected from residential yards located north and south of Standard Scrap Metal. All of these samples were collected with a stainless steel trowel at depth of one to three inches. Sample X106 was taken approximately 87 feet south and 72 feet west of the northwest corner of the 3932 South Wentworth residence in an adjacent vacant lot. Sample X106 was discarded when it was decided that demolition activities may have taken place in the vicinity of the sampling point and may have had an impact on the analytic results.

Sample X105 was collected from the back yard of the residence at 3947 South Wells. It was taken approximately 60 feet east of the northeast corner of the residence. The residence is approximately 200 feet north of the facility. The top inch of sod was removed in order to obtain a good sample. This point was chosen in order to determine if any of the activities at Standard Scrap could have had an affect on the residences to the north and in order to determine if the soil exposure pathway had been affected.

Sample X107 was collected from the front yard of the residence at 3918 South Wells Avenue. The sample was taken approximately 15 feet north and 12 feet east of the northeast corner of the residence. The sampling point was covered with an inch of sod which was removed. The residence is located

approximately 425 feet north of Standard Scrap. This point was chosen in order to determine if any activities at the site may have impacted the surrounding community.

Sample X108 was collected from the back yard of the residence at 3953 South Princeton. It was taken approximately 53 feet east and two feet south of the northeast corner of the residence. A 12 by 12 inch square of sod was removed in order to obtain a good sample. This point was chosen because the resident indicated that ash from the incinerator would cover his yard and home. The resident also indicated that the spot in which the sample was taken had never been disturbed during the time he has resided there. The residence is located approximately 115 feet north of the scrap yard.

Sample X109 was collected from the front yard of the 3941. South Wells residence. It was taken approximately 11 feet south and 25 feet east of the northeast corner of the dwelling. The residence is located approximately 225 feet north of the facility. A 10 by 10 inch square of sod was removed in order to obtain a good sample. This location was also chosen in order to determine what kind of impact past operations at Standard Scrap may have had on the surrounding community.

Sample X110 was collected in the east lot of Standard Scrap

from a pile that appeared to be incinerator ash. It was taken approximately 32 feet south and 47 feet west of the northeast corner of the east lot with a stainless steel trowel. This sample was chosen because it was assumed that it would be the best possible chance at obtaining a "hit" directly from an easily identifiable and measurable source.

Sample X111 was collected from the northwest corner of the east lot of Standard Scrap. It was taken at a depth of six to twelve inches with a hand auger. At a depth of zero to six inches a granular blue/green material was encountered. The sampling point was approximately 11 feet south and 36 feet east of the northwest corner of the east lot. This point was chosen because numerous borings in the vicinity led to the conclusion that the northwest corner of the east lot had been filled in with soils, ash, and metal shavings.

Sample X112 taken from the front yard of the 4059 South Wells residence. After removing the topinch of cover the sample was taken at a depth of one to three inches with a stainless steel trowel. The sampling point was located approximately one foot south and six feet west of the northwest corner of the home. It was taken in order to determine whether contaminants from the facility had migrated towards the south. The residence is located approximately 200 feet south of the facility.

Sample X113 was originally intended for use as the background sample for the site inspection. Upon receiving the analytical results sample X113 was found to be "dirtier" than is normally acceptable for a background sample. The sample was obtained with a stainless steel trowel six feet north and six feet west of the northeast corner of the residence at 4068 South Wells. The residence is located approximately 300 feet south of the Standard Scrap facility.

## 3.7 KEY SAMPLES

The purpose of this section is to provide information on key samples or analytical data obtained during the Screening Site Inspection. During the sampling portion of the site inspection it was decided that sample X113 would be the background. When the analytical results arrived, we realized that the background had elevated concentrations as well. Given that Standard Scrap Metal will be going on to a CERCLA Expanded Site Inspection (ESI), another background sample from another location will be collected during the ESI.

In residential soil samples X108 and X112 laboratory analysis revealed PAH contamination at elevated levels. Analysis from samples taken from Standard Scrap Metal's property revealed the same contaminants but at much lower levels. At first it was thought that these contaminants may have migrated through the air from the incinerator that used to be in operation at the facility. Further research on the subject indicated that

PAH emissions from incinerators is near negligible. These contaminants may have come from a variety of sources. These sources include exhaust from automobiles, the burning of coal, oil, and wood to heat homes, and soot from various industrial processes. In general the contaminants are a product of incomplete combustion.

Polychlorinated biphenyls were found at concentrations above background in soil samples taken from Standard Scrap property. These contaminants can be directly associated with past activities at the facility. As stated earlier in this report, a former rail employee observed workers at Standard Scrap breaking up transformers and letting the oil spill directly onto the ground. The employees then set fire to the oil to dispose of it. This disposal method could also have caused a release of PAH's given the incomplete combustion of a hydrocarbon.

TABLE 3-2
SAMPLE DESCRIPTIONS

Sample	Depth	Appearance	Location
X101	6" – 12"	Dark brown silt with black stained material below.	95' north and 4'5" east of the northwest corner of the Heatbath building.
X102 X103	4" — 8"	Brown to dark brown silt with foreign debris.	29' north and 3' east of the northwest corner of the Heatbath building.
X104	9" — 15"	Brown silty loam with black foreign substance.	73' north and 3' east of the northeast corner of the Heatbath building.
X105	1" - 3"	Black silty loam.	60' east of northeast corner of the residence at 3947 South Wells.
X107	1" - 3"	Dark brown to black loam.	15' north and 12' east of the northeast corner of the residence at 3918 South Wells.
X108	1" - 3"	Black loam.	53'5" east and 2' south of the northeast corner of the residence at 3953 South Princeton.
X109	1" - 3"	Black loam.	11' south and 25' east of the northeast corner of the residence at 3941 South Wells.
X110	Surface	Incinerator ash pile.	Approximately 32' south and 47' west of the northeast corner of the east lot.
X111	6" – 12"	Brown loam with debris and blue/green granular material.	11'5" south and 36' east of a utility pole located in the northwest corner of the east lot.
X112	1" — 3"	Dark brown loam.	1' south and 6' west of the northwest corner of the residence at 4059 South Wells.
X113	.5" – 2"	Dark brown loam.	6' north and 6' east of northeast corner of the residence located at 4068 South Wells.

#### SECTION 4

#### IDENTIFICATION OF SOURCES

### 4.1 INTRODUCTION

This section briefly describes the various hazardous waste sources which have been identified in the initial stages of the CERCLA site investigation.

Information concerning the size, volume, and waste composition of each source has been collected during the initial site assessment reconnaissance visit and the SSI sampling event. The values presented are based on documented visual observations, preliminary investigative reports, aerial photographs, and analytical data. It should be pointed out that the total number and nature of the sources at the site may change as the facility progresses through the CERCLA site assessment process and receives further investigation.

## 4.2 SOURCE #1 - Contaminated Soils

Contaminated soils exist in both lots of Standard Scrap Metal and in the residences north and south of the facility from which soil samples were taken. The contamination of these soils is most likely a direct result of past operations at the site.

Soils samples taken from the facility and the neighboring

residences revealed elevated concentrations of PCB's and low level dioxins which may be attributable to past disposal methods employed by Standard Scrap. These same residential samples also revealed elevated concentrations of PAH's and metals and some low level dioxins. It is possible that the facility may be partially responsible for these contaminants, but it is unlikely that Standard Scrap is the primary source. The residential soils were potentially affected by prior activities at the site, especially stack emissions and wind borne particulate matter.

## 4.3 SOURCE #2 - Waste Pile (Ash Pile)

During the Screening Site Inspection an ash pile was identified by the sampling team at the facility. The pile was located in northeast corner of the east lot on a concrete pad that served as the foundation for Standard Scrap Metal offices prior to their demolition.

An unpermitted wire incinerator was in operation at the facility until at least 1984. The current operators of the facility indicated they no longer burned wire at their premises. A sample taken directly from the ash pile revealed elevated concentrations of PCB's, metals, and dioxins. Particulate matter from the pile could have migrated off-site via the air pathway given its unconfined condition. The employees of the facility are also at risk given their daily exposure to the pile.

### 4.4 SOURCE #3 - Waste Pile (East Lot)

An area in the east lot of Standard Scrap Metal was identified as a waste pile by the sampling team during SSI activities. This area is located north of the present offices and west of the concrete pad which served as the foundation for the old Standard Scrap offices. This area was identified as a waste pile during numerous soil borings in the area which are used as a screening method to obtain a good sample. It was noted during the screening borings that the area primarily fill material composed of incinerator ash, metal shavings, wire, and soils. Analysis of soil sample X111, which was obtained from the fill area, revealed elevated concentrations of metals and dioxins and the presence of PAH's which were found throughout samples taken during the Site Inspection.

The presence of the metals and PCB's in this waste pile can be attributed to past disposal activities that took place at the facility. As indicated earlier the source of the PAH's at this site remains unknown. They may have come from the incinerator and the open burning of the transformer oil, but it is unlikely that either of these would have lead to the concentration levels which were revealed by the analytical results.

The employees of Standard Scrap are the biggest concern due

to the fact that they are in constant contact with the contaminants. Since this waste pile is unconfined there also remains the possibility of airborne particulates being carried from the facility to the surrounding community.

### SECTION 5

### MIGRATION PATHWAYS

### 5.1 INTRODUCTION

This section includes information that may be useful in analyzing Standard Scrap Metals impact on the four migration pathways identified by the CERCLA Hazard Ranking System (HRS). The migration pathways which will be analyzed in this section are air and soil exposure.

### 5.2 GROUNDWATER PATHWAY

Groundwater samples were not collected during the Screening Site Inspection conducted at Standard Scrap Metal. The vast majority of residents in the City of Chicago receive their drinking water from intakes located on Lake Michigan.

### 5.3 SURFACE WATER PATHWAY

Surface water samples were not collected during the Screening Site Inspection conducted at Standard Scrap Metal. Surface water run-off from Standard Scrap enters directly into the storm sewers. The site is located in a heavily urbanized area and it would be difficult to attribute the contaminants found at the discharge point to operations at Standard Scrap given the variety of potential sources that could have affected the storm sewers.

### 5.4 AIR PATHWAY

No air samples were collected and there was no incineration taking place during the Screening Site Inspection.

Conversations with residents in the surrounding community suggests that there have been releases to the air pathway on numerous occasions during past operations at Standard Scrap Metal. Residents in the area immediately surrounding the facility were interviewed during the Site Inspection. These residents reported particulate matter coming from the incinerator at Standard Scrap, falling to the ground and leaving a light coating on exposed surfaces. This would indicate a potential for airborne particulates to carry contaminants off-site.

	Table 5-1	
Estimated	Air Target Populations	
On a source	6	
>0 to 1/4 mile	1,552	
>1/4 to 1/2 mile	11,850	
>1/2 to 1 mile	37,586	
>1 to 2 miles	51,000	
>2 to 3 miles	57,000	
>3 to 4 miles	63,000	

According to U.S. Department of the Interior "National

Wetland Inventory Maps", no wetlands are located within 1/2 mile of Standard Scrap Metal.

### 5.5 SOIL EXPOSURE PATHWAY

Soil samples taken during the Screening Site Inspection indicated releases of contaminants to nearby soils that may be attributable to Standard Scrap. Several inorganic compounds, PCB's, and dioxins were found in on-site soils, with PCB's and dioxins detected in off-site residential samples as well. The compounds found in the soil samples taken from Standard Scrap property are summarized in Table 3-1.

The inorganic compounds and PCB's found in residential soil samples X105 - X113 meet the criteria for observed contamination to the soil pathway. The resident population at which samples were taken is as follows; two residents at X105, at least eleven residents at X107, five residents at X108, and three residents at X109. The remaining residential properties lie between points of observed contamination, with a total population of 70 residents in these homes. The residential population does not include the six full time workers at the Standard Scrap Metal site. All residential soil samples were collected within 150 feet of the homes and within the top foot of soil. The overall residential population was estimated using a 2.72 person per household average for Cook County. The estimated population within one

mile of the site is provided in Table 5-2.

+	+
	Table 5-2
	Estimated Soil Target Populations
ļ	
	On a source 6
	>0 to 1/4 mile 1,552
	>1/4 to 1/2 mile 11,850
	>1/2 to 1 mile 37,586

No designated terrestrial sensitive environments are located nearby. Site access to the east lot is restricted by a eight foot high chain link fence. Access to the west lot is also restricted by an eight foot high chain link fence, but there is a hole in the fencing where it appeared that people had passed through. The facility is approximately three acres total in size counting both lots.

### TARGET COMPOUND LIST

4- - 1 Table 8

### Volatile Target Compounds

Chloromethane Bromomethane Vinyl Chloride Chloroethane Methylene Chloride Acetone Carbon Disulfide 1,1-Dichloroethene 1,1-Dichloroethane 1,2-Dichloroethene (total) Chloroform 1,2-Dichloroethane 2-Butanone 1,1,1-Trichloroethane Carbon Tetrachloride Vinyl Acetate Bromodichloromethane

1,2-Dichloropropane cis-1,3-Dichloropropene Trichloroethene Dibromochloromethane 1,1,2-Trichloroethane Benzene trans-1,3-Dichloropropene Bromoform 4-Methyl-2-pentanone 2-Hexanone Tetrachloroethene 1,1,2,2-Tetrachloroethane Toluene Chlorobenzene Ethylbenzene Styrene Xylenes (total)

### Base/Neutral Target Compounds

Hexachloroethane bis(2-Chloroethyl)Ether Benzyl Alcohol bis(2-Chloroisopropyl)Ether N-Nitroso-Di-n-Propylamine Nitrobenzene Hexachlorobutadiene 2-Methylnaphthalene 1,2,4-Trichlorobenzene Isophorone Naphthalene 4-Chloroaniline bis(2-chloroethoxy)Methane Hexachlorocyclopentadiene 2-Chloronaphthalene 2-Nitroaniline Acenaphthylene 3-Nitroaniline Acenaphthene Dibenzofuran Dimethyl Phthalate 2,6-Dinitrotoluene Fluorene 4-Nitroaniline 4-Chlorophenyl-phenylether

2,4-Dinitrotoluene Diethylphthalate N-Nitrosodiphenylamine Hexachlorobenzene Phenanthrene 4-Bromophenyl-phenylether Anthracene Di-n-Butylphthalate Fluoranthene Pyrene Butylbenzylphthalate bis(2-Ethylhexyl)Phthalate Chrysene Benzo(a) Anthracene 3,3'-Dichlorobenzidene Di-n-Octyl Phthalate Benzo(b) Fluoranthene Benzo(k) Fluoranthene Benzo(a) Pyrene Indeno(1,2,3-cd)Pyrene Dibenz(a,h)Anthracene Benzo(g,h,i) Perylene 1,2-Dichlorobenzene 1,3-Dichlorobenzene 1,4-Dichlorobenzene

### Acid Target Compounds

Benzoic Acid
Phenol
2-Chlorophenol
2-Nitrophenol
2-Methylphenol
2,4-Dimethylphenol
4-Methylphenol
2,4-Dichlorophenol

2,4,6-Trichlorophenol 2,4,5-Trichlorophenol 4-Chloro-3-methylphenol 2,4-Dinitrophenol 2-Methyl-4,6-dinitrophenol Pentachlorophenol 4-Nitrophenol

### Pesticide/PCB Target Compounds

alpha-BHC
beta-BHC
delta-BHC
gamma-BHC (Lindane)
Heptachlor
Aldrin
Heptachlor epoxide
Endosulfan I
4,4'-DDE
Dieldrin
Endrin
4,4'-DDD
Endosulfan II
4,4'-DDT

Endrin Ketone
Endosulfan Sulfate
Methoxychlor
alpha-Chlorodane
gamma-Chlorodane
Toxaphene
Aroclor-1016
Aroclor-1221
Aroclor-1232
Aroclor-1242
Aroclor-1248
Aroclor-1254
Aroclor-1260

### Inorganic Target Compounds

Aluminum
Antimony
Arsenic
Barium
Beryllium
Cadmium
Calcium
Chromium
Cobalt
Copper
Iron
Lead
Magnesium

Manganese
Mercury
Nickel
Potassium
Selenium
Silver
Sodium
Thallium
Vanadium
Zinc
Cyanide
Sulfide
Sulfate
